THE DESERET WEEKLY.

A 32 to 48 page Magazine, the cheapest and finest in the country, specially suitable as a value to missionary fathers. Price, per volume of 24 numbers, $2.00; per copy, $0.05; single.

MAGIC.

When the opaque leaves left to the oak are gone
And free at their bought and fight is now,
And the white sails of ships are seen afar
Where the after light lies dead and drear—
Then, silver again
Come days that have been—
Dead many a year—the dead a year!

When the wild drake sails in the early night,
When the plashy pools give back full light,
And above the pool-lily's cup and cup of white
The fairies pass by on their velvet flight—
Then, oh for the days
Some years ago—
And their dear delight—one little dear delight!

—R. T. Turner in Springfield Republican.

THE EGG STEALER.

It wanted less than hour to high tide when Miss Marty Lear loaned her brother's boat gratis on the narrow beach below the garden, and set the oarsmen and glasses straight while she listened for the rattle of the garden gate.

A scanted line of hazel ran along the foot of the garden and prevented all view of the landing place from the kitchen window. But above the hazels one could look across and catch a glimpse, at high tide, of the intervening river, or, toward low water mark, of the sandbanks shining in the sun.

It was Miss Lear's custom to look much on this landscape from this window had, in fact, been her custom for close upon forty years. And this morning, when the latch clicked at length, and her brother in his market suit came slouching up the path that broke the parallels of garden stuff, her gaze rested all the while upon the line of gray water.

Nor, when he entered the kitchen and hitched his hat upon the peg against the wall—where its fellow accurately fitted a sort of dull hale in the wainscoat—did he appear to want any welcome from her. He was a long jawed man of sixty-five, she a long jawed woman of sixty-one; and they understood each other, having kept this small and double farm together for twenty years—since their father's death.

There was a cold pasty ready on the table, and the jug of cider that Job Lear regularly emptied at supper. These suggested no questions, and the pair sat down to eat in silence.

It was only while holding his plate for a second helping of the pasty that Job spoke with a full mouth.

"Who d'ye reckon I ran against today, down in Twyf"

Miss Marty cut the slice without troubling to say that she had not an idea.

"Why, that fellow Amos Trudgeon," he went on.

"Yes."

"Yours to me you disremember 'em—sort of—as Jim Trudgeon had used to live 'cross the water, him that stole our eggs, long look, when father was livin."

"I remember."

"I thought you must. Why, you gave evidence, to be sure. He doesn't seem a mess to mind, if you wasn't the first to wake us up an say you heard a man cryin out 'pon the mind."

"Yes, I was."

"An saved his life, though you did get 'em two months in jail by it. Up to assizes, he was, an not two minutes to live, when we hauled 'em out an found he'd been stealin our eggs. He inquired after you today."

"Did he?"

"Yes. 'How's Miss Marty,' says he. 'Again rapidly,' says I. 'The reason that mine talks hard.' 'Comes up to a cool of my lord and holds out his hand. I'd a mind to say 'Eggs' to 'im, it an aint I loaded 'em; but I made the best. 'Tis an old tale after all, that feat of his."

"Two an forty year, comin seventeenth of July next. Did he say any more?"

"He wanted to know if you was married."

"Oh, my dear God!"

Job laid down knife and fork with the edges resting on his plate, and with a lump of pasty in one cheek looked at his sister. Before he could speak she broke out again:

"He was my lover."

"Mat—ty!"

"I swear to you, Job—here across this table—he was my lover; an I ruined 'em. He was the only man, 'cept you an father, that ever kissed me; an I betrayed 'em. As the Lord liveth, I stood in the fire an swore away his name to save mine. An what's more, he made me."

"Mat"—

"Don't hinder me, Job—it's truth I'm tellin ye. His people were a few lot, an father'd have hidden me if he'd know. But we met to meet in the orchard, 'mons every night. Amos'll vow across in his boat, an back again. For the Lord's sake, brother, don't look so. I'm just sixty, an so here down an how will an good's the same to me."

"Go on."

"Well, the last night he came over, 'twas low tide. I was waitin for 'im in the orchard; an he would have me tell father and you, and I wouldn'. I reckon we quarreled over it so long he had grit left high in his mind. Anyways, he left me in the dark, an I stood there by the gate in the dark longin for my lover to come back. But the tides went on, an I did't. Low tide came, pulin away, though lovers wish tell my work.

"An then I heard a terrible sound, a low sort of breathin, but heavy, an something wrong, a sick sickness of the soul know, an fear came. There he was, every his knees in it, half way between first ground and his boat. For all his Rightly he heard me and stumpers out of the dark.

"Little girl, it's got me. Hold don't shove."

"Can's you get out? I whispered back.

"No, I'm afraid.

"Will you an call father an Job?

"Hold! Do you mean? Do you want to let 'em drown?

"Yes, I'll kill you, dear, won't it?

"Leave it will," and he. "Then after a wrinkle of battlin with it he whispers agen. 'Little girl, I don't want to die. Faith is a soft end. But I reckon we can manage to save one an your name as well. Run up to the beaknow an bring me as many eggs as you can find—and don't ax questions. Be quick. I can keep up for awhile.'

"I didn't know what he meant, but ran up for my life. I could tell pretty well how to find a dozen or more in the dark by groping about, and in three minutes had gathered 'em by the hay at my dress, and ran down again. I could feel spy late—a dark hint on on the mud.

"'How many?' he asked, his voice hoarse as a crow's.

"'About a dozen.'

"'Fling 'em down. Don't come too near, an stay careful, and I can catch. Quick!'

"I stepped down pretty near to the brink of the mud an tossed 'em out to him. Three fell short in my hurry, but the rest he got hold of, somehow.

"'That's right. They'll check any stealth extend to a few family hen eggs. Now have to your cross, unless anyone out, carte there's a man coming for help down 'pon the mead. When you warn your carelle below I the window I'll shout like a Trojan.'

"An I did it, Job, for the reality to a fearful woman pause knowledge. An you respond on, an he went to jail. For he said 'twas the only way. An he neither look it an quite comfortable that her husband's one didn't take to to bad—'twas the way of all the Trudgeons.

"You couldn't look at me like that, I'm past sixty, an I've done my share of repentin. He didn' say if he was married, did he?"—Arthur Quiller Couch in London Speaker.

A Sacred Log.

There is a log of yellowish colored wood standing just outside of Old Hue gate, Pekin. This log has remained in its present position since the fall of the old Ming dynasty. It is in good preservation and has commanded the respect of all classes and conditions of people. Insects in China usually make inroads in timber in a very short while, but they are and never to alight upon this sacred tree trunk, and it is true that they have not left a single trace of their work upon it, while the timbers in every direction are a perfect honeycomb of insect work.

The Chinese people believe that the log is the habitation of some god, and on that account gather and worship at its base at least once a year. Among the higher classes the day for this unique species of worship is the first of each succeeding month, unless that day should happen to be a new moon day. Oct. 1 of every year the emperor commands the board of ceremonies to appoint a committee to pay their respects to the dulled log.—Chicago Times.

Man's Relation to His Country.

Not recognizing the fundamental distinction between a society which, having fighting for its chief business, makes contribution subordinate, and a society which, having contribution for its chief business, makes fighting subordinate, there are many who assume that a disciplinary yeller appropriate to the first is appropriate to the last state. But the relations of the individual to the state are in two cases entirely different. Unlike the Greek who, not owning his self was owned by his city, the King subject is not in any appreciable degree owned by his nation, but is a very positive way owns himself. Though, if of age, he may on great emergency be taken possession of and made to help in defending his country; yet this contingency qualifies to but small extent the private possession of his body and the self directing of his actions.—Herbert Spencer in Popular Science Monthly.

Men Who Do Not Smoke.

There is a prevalent idea that men who abstain from tobacco indulge to excess in some other stimulant. There is some truth in this. Tobacco, when enslaved tobacco as a weed that injured the body, attacked the intellect and crippled the nations, drank great quantities of coffee, which produced the terrible nervous disease that shortened his life.

Goethe was a smoker. So was Dickens. But the former is computed to have drank some 20,000 bottles of wine during his lifetime, and the latter took a tremendous quantity of spirit. Nevertheless it must be acknowledged that a very large number of brain workers indulge in no stimulants whatever, or use them very sparingly.—New York Sun.

The Magnetic Button Fastener.

A clever adaptation of electricity is found in the magnetic button fastener. The difficulty in the pressure machine has been the clumsiness of a plan sufficiently simple for feeding the buttons from the receiving hopper on the top of the machine down to the tube leading to the stamping mechanism. This is now effected by the magnet, which, placing up and down in the hopper through a slot in the bottom, attracts several of the loose buttons at each upward movement. On the downward stroke the buttons which cling to the magnet are rubbed off into a little trough.—New York Telegram.

Quarrying Salt in Kansas.

Nearly 100 feet below the rolling prairies on which Lyons, Kan., stands we are quarrying rock salt. The supply is simply inexhaustible, as drills have penetrated it to the depth of 300 to 400 feet. The salt is almost pure, the foreign elements not being more than 3 percent. of any given bulk or quantity. We mine the salt outright, while at Hutchinson they get it out by pumping fresh water on to the first salt, then pump the salt water and then evaporate it. Our method is cheaper and more satisfactory.—Interview in St. Louis Globe-Democrat.

Easily Answered.

A professor in a German medical college had one exceptional student.

"You see, Herr Doctor," said the professor to the young man one day, "the subject of this diagram large tumor one of his legs is a tedious shorter than the other. Now what would you do in such a case?"

"I should limp, too, I think, Herr Professor," replied the student with an expression of perfect innocence on his stupid face.—Anthropos.

About this time of year editors must in instruction and pun resolutions relating for laws to prevent his dodging. Then they go home with a consciousness of having done their duty and let their personal property at the lowest rates it would bring at forced sale.

The Sun Light Needed.

Scientists have long sought for a cheap and invariable standard of length. The measures in common use are more or less variable, and, if the original standards should be destroyed, would not be accurately replaced. The French metre is supposed to be a ten millionth part of the quadrant of the earth, but the measuring of the original measurements have been seriously called in question. Therefore, the so-called "wave length" of light have been suggested as furnishing an invariable numerical magnitude, but their excessive minuteness and the difficulty of accurately measuring them have hitherto been an objection to their use.

It is said that a method of measuring these wave lengths, which is so simple as to be one too ridiculously put, has been discovered. When it is considered that a wave length of sodium light is only about one-forty-thousandth of an inch, the extreme delicacy of this method becomes apparent. Whatever theory may be held as to the nature of light, its numerical value, called "wave lengths" for convenience, are actual and invariable representatives of something; and if the proposed new method of measurement proves reliable, there will be no difficulty in obtaining a fixed standard of length which can be reproduced at any time or place.

A Giant Wonderland.

The hot of the Colorado desert today may well afford a study to the seeker after marvels as well as to the geologist. It is a desert wonderland. Imagine a plain of clay, smooth as a floor, polished here and there by hills of sand hills in incredibly variegated outlines. These hills are not stationary; they travel constantly, though slowly, journeying over the plain as the winds direct. The sand of which they are composed is not the ordinary sand at all, but of a quite marvelous. Most of the grains are transparent, others are translucent, while many are of rainbow hues, being in fact small gems of red carnelian, green chrysolite and variegated jasper.

Looked upon beneath a microscope they are most interesting. A majority of them are perfect spheres, rounded and polished by attrition with each other. When mixed with a familiar sand they effervesce like soda powder. Composed of these gems, of weight and metals, the sandhills look like great monoliths, with here and there a gleam of color. Continually they give forth a rolling sound as the tiny spheres are shifted by the winds, slowly rolling onward.—Washington Post.

How Some Insects Sing.

The Greeks sent the cicadas in cages so as to be music to them in their shop. The Greeks were at odds concerning the nature of the sounds produced, and the controversy among naturalists on the subject lasted till very recently. The problem, H. Landois, who investigated the different subject of animal sounds with considerable industry and great skill, was able to give a satisfactory solution to the question. According to his research, the case is one in which the sound is really made by air circulating through passages to the interior of the body.

Every insect's body is punctated by a system of breathing tubes or trachea which open at places on the surface. The openings are called stigmata. The system of breathing tubes, through which the air is inspired and expired, takes the place of the lungs of the higher animals. Landois discovered them in every element parts of the cicada, and found that they form a kind of windpipe representing the sound tone factory of the animal.—R. Transmitted in Popular Science Monthly.

A chair propelled by electricity from a storage battery placed beneath the seat is the latest luxury for the invalid. One charging will last for fifty miles of travel.

A Lowell barber has just completed a picture made from 18,000 pieces of wood. The wood was obtained from 100 lead cigar boxes and is mostly Spanish cedar.

"German Syrup"

J. C. Davis, Rector of St. James' Episcopal Church, Eufaula, Ala.: "My son has been badly afflicted with a fearful and threatening cough for several months, and after trying several prescriptions from physicians which failed to relieve him, he has been perfectly restored by the use of two bottles of Boschee's German Syrup. I can recommend it without hesitation." Chronic severe, deep-seated coughs like this are as severe tests as a remedy can be subjected to. It is for these long-standing cases that Boschee's German Syrup is made a specialty. Many others afflicted as this lad was, will do well to make a note of this.

J. F. Arnold, Montevideo, Minn., writes: I always use German Syrup for a Cold on the Lungs. I have never found an equal to it—for lung a superior.
