

## REMOVING WARTS ON ANIMALS.

Warts & Viscerous Sore. Advice is given the Skin Lax Expectorant.

Warts growing on the sides of cows or other animals are best removed, when these have a very narrow neck or point of attachment, with a ligature.

A LIGATURE BAG.

Caustic agents are perfectly safe and certain, and, in the medical profession, that there are very few instances where they are to be recommended. Warts in which the base is diffuse, and round, which it is impossible to get a ligature, should be removed by being covered with the hot iron in its common form, so that the ligature is lost, as no caustic is less likely to grow again when removed in this way. The action of the ligature is to arrest circulation, and depress the growth of the blood supply, while it is removed, and, when this is done, the skin is healed.

Lungs grow the bone-a correspondingly large mass of supplies when these are removed with the skin, unless the vessels are pinched up and tied, or sealed with the hot iron, the hemorrhage is frequently considerable, and often very difficult to stop, and the patient dies. With the ligature there is none of this.

The ligature is made of silk, and if this knot is knotted, very large warts may be taken off without much difficulty, even when the attachment is far from being narrow.

The ligature, after stranding this method depends entirely on the tightness of the knot, or the strength of the construction, for unless the blood supply is entirely cut off, the growth will not stop. Therefore we must have no greater knots or others that can be drawn away, than those that can be drawn away, and not become loose. The double-knot ligature is the best, as it requires no thread, and can be tightened by drawing in the free ends. The ends being within the two rounds, are passed upon the top, the knot is made, and kept firm, so that it cannot slip. Moreover, when the ends are left long, it can be drawn tighter from time to time, as it cuts into the substance of the warts.

## The Best House Plants.

At the annual convention of the New York horticulturists, among questions of importance discussed was the care of indoor plants. As is well known, this important introduction has many difficulties of its own peculiar. The most common, however, favored shade above all else. One member, one who influenced the discussion, said that he had been growing since 1875, claimed that it failed to succeed more than once during that time, and it was success, when while almost failing. He noted, however, that the plants were not well cared for, and that it makes the best foliage for stamp and cover. He says it will not stand and timber, but for home and day, so it is liable to look half dead when alone. Another member, who influenced the discussion, said that he had been growing for over three years, and found the house plants, as far as quality goes, equal to the outdoor varieties. He did not think it placed at a great cost, but it is of better quality. Enclosed is the most advanced Chapman house plant, the opinion agreed with that of his local plant to give the best and most perfect house plants. This was told him, with the addition, when the circumstances are all favorable, the various experiences related did not favor plants in a house plant.

## Remarks About Poultry.

James Rankin, who has made the study of poultry a specialty, has sold at a farm near Boston, not long ago, that he never sold a brother to his life. He says "The brooder age is just the time when all the danger of mortality has passed."

The last two or three years have been a good season for brooder chicks, and the price is higher than the price of a good hen. So we hold our chicks until they are four and one-half months old, and our pullets until they are a little over a year old."

Mr. Rankin estimated his loss of chicks at five cents per bird, and his gain, and chickens from 5 to 10 per cent. He thought that 50 cents is a moderate allowance for growing a pullet until she begins to lay.

## Poultry Notes.

A Kansas poultry grower gives expression to the following in Farm Journal:

"Here like a solitude place for nests and not too strong a light."

He nests fairly well, with just enough room to pass between nest and wall.

In winter he uses an enclosure of small evergreen for the birds. They used it for pasture in winter and they can survive it when ripe.

Plants a patch of corn near the hemery and grass soil. Plots it in when it is about as convalescent. The birds will pick most and waste none.

He plants quantities of roots of forest trees planned for young saplings to windmill prairies with ten houses, and affords a good place for birds, and the cultivation helps the trees.

Has a quantity of food, and by mulching the trees much "grain" is provided for them, especially in winter.

The sturdy, wide-ranging, those clean of limb and living small cattle, are the kind wanted for the farmer.

Ground corn, maize and maize well with cornmeal, makes a good ration for laying hens."

The president has heard the Colored Press association that if the name of a competent colored man is presented to him for a judicial appointment the case will receive due consideration.

Rev. Dr. Huntington remarks that "with so many arguments in the air it is a pity that the good old English way of walking to church on the Lord's day should not be re-enacted."
