Agricultural Implements, &c.

Sole Agents in Utah for the Celebrated

STUDEBAKER WAGONS

We take pleasure in referring
those who wish to buy, to parties
whom we have supplied, as to the
class of goods sold by us and our
mode of doing business.

H. B. CLAWSON,
Superintendent.

Wanted, in any quantity.

Large or small, WHEAT.

OATS, BARLEY, CORN.

EGGS, HIDES and WOOL.

for which the HIGHEST

MARKET PRICE WILL

BE PAID.

EVENING NEWS.

Wednesday, October 13, 1875.

How to Hatch and Raise Poultry.

There is an establishment at the
pleasant village of Hicksville, L. I.,
which would well repay a visit
from our farming friends and others
leading a country life. The place
in question is owned by Prof.
Adolphe Corbett, a Belgian gentle-
man, who there carries on the ven-
erable business of hatching and
raising poultry of every description
by artificial methods, he himself
being the inventor of the process.
Poultry breeders are well aware
that the use of the hen is entirely
unnecessary so far as hatching is
concerned, her value beyond egg-
laying being confined to sheltering
and warming the chickens after
they burst their shells. A hen
lays on an average some 100 eggs
annually, but she only sits once,
hatching seldom more than seven
during her period of incubation. If
she could hatch the whole number
she lays, or four-fifths only, there
would clearly be a far greater
chance of profit for the breeder.
and many devices have, in conse-
quence, been set on foot to substi-
tute artificial means for the mother-
ly duties of the hen. Prof. Corbett
claims to have accomplished this
result by his discovery, and as he
is carrying out his invention on an
immense scale at Hicksville, the
readers of the *Evening News* may learn
something from a report of his op-
erations.

The area of the estate covers 100
acres, and is handsomely fenced in.
Most of the land is under grass, the
chickens have full liberty to roam
over it, while other portions are
given up to the cultivation of corn
and buckwheat, with rows of esp-
ply trees with fruit. The buildings
of their convenience are numerous
and extensive, but yet might be
increased tenfold when occasion
demands, without unduly increas-
ing the immense area. The principal
edifice is a frame structure,
200 feet long by 23 feet wide
and 25 feet high; it is in two
stories, and 100 windows give am-
ple amount of light and ventilation
throughout. Here the operations
of incubation and nursing are car-
ried on, the sole calorific agent em-
ployed being horse manure. The
so-called "incubators" are peculiar-
ly shaped wooden boxes, capable of
hatching 100, 200, or 1,000 eggs
at a time, according to size of ap-
paratus. The eggs being placed in
their proper receptacle, the incubator
is then covered around and over
with the strongest horse manure,
that produced from oats and corn,
not grass, hay, or clover. A ven-
tilation chimney carries off the
gases and effluvia from the box,
and also enables the operator to
regulate the temperature of the
interior at the required 104 deg.
Fahrenheit. The apparatus might
now be left entirely alone for the
usual term of incubation, that dif-
fering according to the species of
fowl being hatched; but it is cus-
tomary to examine each egg separat-
ely on the third or fourth day,
the "clear" or unproductive ones
being returned to the basket.

When the chickens are hatched
they are forthwith removed to the
"artificial mothers," and the little
ones apparently take to these scien-
tifically constructed shelters with
as much gusto as to a living hen.
These mothers caused the inventor
two years' severe study and an en-
ormous loss in eggs; and it was not
until he discovered how to do away
with all corners in the apparatus,
and to make the cover or roof rest
without weight on the backs of the
little ones, that he accomplished
his purpose. This included the
gradual raising of the cover with the
growth of the birds, as also the pro-
per selection of material of construc-
tion so as to insure the necessary
amount of heat required within.
No stronger or healthier chickens
can be seen than those hatched
and raised by this process, and
there is an entire absence of lame
chicks which we always find when
brought up with brood hens.

Another building, 100 feet long
by 14 feet wide and three stories
high is set apart for the young pul-
lets and egg-laying hens. Prof-
Corbett, who is an accurate ob-
server of the habits of domestic
poultry, and a well-known writer
and authority on such subjects in
France and Belgium, has done
away with the nightly fighting,
squabbling, pushing and fowling
sweating at roosting time by plac-
ing all his perches at the same lev-
el. Most truly democratic is this
not in our party, American sense,
but according to the old Greek
meaning—*demos*, the people. So
the fowls, young and adult, go to
rest affectionately.

A first consideration in stock-
raising of all kinds is pure, fresh
water and absolute cleanliness.
In the establishment described the
drinking fountain is situated
over the grounds, some being of
earthware, others in iron, and
the water is changed frequently.
All the buildings are lined inside
with brick and plaster, constant
use of whitewash on the interior
and the sprinkling of carbolic acid
on the floors insuring perfect clean-
liness.

Not far removed from the last
named building, but completely
isolated, is an extensive duck-
house, with a fine front. The
ducks, like all other fowl in the
establishment, are hatched and
nursed by the simple use of horse
manure, and their goodly apper-
taining stock is managed with the
quickness of movement, above their
perfect healthfulness.

All known descriptions of domes-
tic poultry and fowls are raised
on this estate by the above-men-
tioned methods. These descriptions in-
clude: turkeys, Dorkings, Game,
White Leghorns, Black Spanish,
Brahmas, Shanghaies, and as some
amateurs choose to call them, Co-
chin-Chinas, and Brahmipootras.
They are all alike amenable to the
same system, as well as geese, tur-
keys, ducks, partridges, and all of
them are equally productive and
remunerative.

Prof. Corbett's establishment is a spec-
ies enables anyone to raise poultry
—whether on a small or large scale—
at from 20 to 35 per cent. less
cost than by any ordinary method.
He states, moreover, that the farmer
will obtain far more remunerative
results from an equal area of land
in raising poultry than for any
other stock-raising business, and
that his process is alike valuable to
the housewife of moderate means,
as the farmer's leisure moments in the
poultry-yard, as well as the grower
of large scale who seeks to supply
great city markets with eggs and
chickens. He makes no secret of
the success he has attained, and in-
vites all to visit his establishment
in order to see his system adopted in
every farm and country house in the
land of his adoption, as well as in
the *Evening News*.
