EVENING NEWS.

Wednesday, June 14, 1876.

Happy Accidents.

Seldom do men sit down with a steady resolve, a determined purpose, to discover some new principle or invent some new process. When they do so, there is a lurking idea of the kind of thing they want, a dim perception of the direction in which success may most reasonably be sought. Generally speaking, something is concerned which, for want of a better term, we call "accident." An appearance presents itself, or an effect is produced, which the observer neither designed nor expected; an accident certainly, so far as he is personally concerned. It may be a manifestation, until then unknown, of some natural force or property; or it may be an action of one substance on another, susceptible of useful practical application. Thus is briefly expressed, the distinction between a *discovery* and an *invention*. But the important point to notice is, that the value of the accident depends on the kind of man, or kind of mind, by whom or by which it is first observed. If the soil is not sufficiently prepared, the seed will not grow. Thousands of men had seen light reflected from distant windows, and variations in the light according to the angle of reflection; but a well prepared mind, on one occasion, suddenly drew from this phenomenon an idea which established the beautiful science of the Polarisation of Light.

It is pleasant to read of the manner in which shrewd minds have turned an accidental observation to practical advantage.

Galileo, being one day in the cathedral at Pisa, watched the oscillations of a lamp suspended from the roof. He observed that the swings or vibrations were all performed in equal times, whether the arc of swing were great or small—whether the lamp had only just begun to oscillate, or had nearly finished. Following up the observation when he returned home, he made temporary pendulums of various lengths, any kind of heavy weight suspended by a string; and he found that the time of oscillation for each pendulum bore a definite ratio to the length of string. Armed with this two-fold knowledge, he virtually gave birth to the application of the pendulum as a regulator of clocks—an invention to which the precision of modern astronomy owes so much.

What to say of Sir Isaac Newton and the apple, we scarcely know. Some biographers pass by the incident without notice, some express a doubt of its truth; while others see no reason why an acute mind, trained to mathematical thought, should not draw a valuable conclusion from the incident observed. The story runs thus, in the words of Pemberton, the contemporary and friend of the illustrious philosopher: "One day, as he was sitting under an apple tree at Woolsthorpe, an apple fell before him. This incident, awakening in his mind the ideas of uniform and accelerated motions, which he had been employing in his method of fluxions, induced him to reflect on the nature of that remarkable power which urges all bodies to the centre of the earth. * * 'Why,' he asked himself, 'may not this power extend to the moon; and then what more would be necessary to retain her in her orbit about the earth?' This was but a conjecture, and yet what boldness of thought did it not require to form and deduce it from so trifling an accident!"

The reflecting apparatus for lighthouses arose out of a wager, if the facts are correctly recorded. Somewhat more than a century ago, among the members of a small scientific society in Liverpool, one offered to wager that he would read the small print of a newspaper by the light of a farthing candle placed ten yards or thirty feet distant. The wager being accepted, he coated the inside of a wooden board with pieces of looking glass, forming a rough substitute for a concave mirror; placing a small lighted candle in front of this mirror, the rays of light were reflected and converged to a focus ten yards on the other side of the candle, and the light at that focus was sufficient to enable the experimenter to read a newspaper. Of course the distance of the candle from the mirror was made dependent on the curvature of the mirror itself. An observant practical man, dockmaster of Liverpool, was present. The idea flashed upon him, that if the light of a farthing candle could in this way be thrown out to a distance, the light of a large lamp could similarly be projected to a mile or miles away. The idea grew into form, and resulted in the invention of the reflecting lighthouse, or rather the reflecting apparatus for lighthouses.

One day, Lundyfoot, a snuff manufacturer, was drying some snuff, a necessary process in its preparation. Through a little neglect, the snuff was allowed to be overheated, till it became charred, scorched, or burned. In the view of a prosy, jog-trot tradesman, the commodity would have been thrown away as spoiled; but this manufacturer, noticing the pungent character of the snuff, and how it tickled the nose, and knowing that some men like to have the nose tickled more than others, resolved to try whether "high-dried snuff" could be brought into favor. It not only did so, but proved a source of wealth to him. Any man may burn a commodity by carelessness; it is the observant mind who ingeniously turns the accident to a good account.

The writer has seen a piece of printed calico or muslin that exemplified the way in which an accident led, not exactly to an invention permanently useful and profitable, but to a pattern that had a great success in one particular year. A piece of cotton being printed at one of the great Manchester establishments, became a little displaced. While travelling upwards from the printing cylinder, a portion of the cloth shifted into some disarrangement, and was printed a second time, but in a different direction from the first. The effect was very singular. The original pattern was a simple one; but the diagonal repetition produced a forked-lightning effect of a kind which a designer would not have been likely to hit upon. The master-printer took a hint from the accident: he suggested the engraving of a design in which the forked-lightning effect should be utilised. It proved to be one of the most successful patterns ever introduced by the firm. The reader may form some idea of the way in which this fortunate mishap occurred: for one corner of a newspaper sometimes accidentally gets printed a second time, but at a different angle. A muddle it makes when the impression consists of words and sentences; but when it consists of geometrical lines or fanny arabesques, the product may be a fortunate one to a man who has his wits about him.

One of the producing causes of prosperity of the Staffordshire pottery manufacture was the discovery of a cheap durable glaze, applicable alike to brown ware and white ware, and greatly increasing their usefulness by making the surface impervious to water. The discovery, according to Shaw, the historian of that county, was due pure-

district), a maidservant was one day heating a strong solution of common salt, to be used in curing pork. During her temporary absence from the kitchen, the liquid boiled over. Being in an unglazed earthen vessel, the solution spreading over the outside, produced a chemical action which she little understood, and which did not compensate her for the scolding she received. Some of the elements of the liquid combined with some of those of the highly heated brown clay surface to produce a vitreous coating or enamel, which did not peel off when the vessel was cold. The humble brown-ware vessel acquired a historical celebrity. A Burslem potter, learning what had taken place, saw that glazed ware might possibly hit the taste of the public; he introduced the system of glazing by means of common salt, a system at once cheap, easy, and durable; and England has made many a million sterling by the discovery.

One of the pleasantest anecdotes illustrative of an invention being suggested by accident, bears relation to the stocking-loom or knitting frame. The story has been told in two or three different forms; but the most popular version accords with a picture and inscription preserved by the Framework Knitters' company. About a hundred and ninety years ago, Mr. William Lee, of St. John's College, Cambridge, was expelled for marrying in disregard of the statutes of his college. Having no fortune on either side, his young wife contributed to their joint support by knitting. The husband watching one day the movements of her fingers, suddenly conceived the idea of imitating them by mechanical means, in order that she might get through her work in a manner easier to herself and perchance increase her emoluments. The ingenious stocking-frame was the result of his cogitations. In hand knitting, polished steel needles or wires are used to link threads together into a series of loops, closely resembling those produced in tamboring. In framework knitting one person can manage a large number of knitting needles at once—pieces of steel midway in shape between straight wires and bent hooks, and aided by jacks or vibrating levers, treadles, rows of bobbins and other clever contrivances. William Lee's first stocking-frame was in all probability small and very rough; but it had in it a potentiality (as Dr. Johnson might have called it) of developing great things, until at last it has culminated in that masterly piece of mechanism the circular rotary hosiery machine.

Lucky accident, in like manner, led, about the year 1764, to the invention of the spinning-jenny, one of the foundations of the amazing prosperity of the cotton manufacture. But as in most instances of the kind, the soil was prepared in some degree for the reception of the seed, the accident would probably have passed unnoticed if there had not been a mind in a condition to appreciate it. James Hargreaves, of Standhill, near Blackburn, was a humble man who lived by handspinning and weaving, his wife and children aiding in their several ways. He succeeded in expediting his work by inventing a carding-machine to comb out or streighten the fibres of cotton, as a substitute for hand-cards (wires inserted in a flat piece of wood). In spinning, after the carding and other preparatory processes had been completed, he frequently tried to spin with two or three spindles, or two or three spindles at once, by holding two or three separate threads between the fingers of his left hand, and thus double or treble the amount of work effected in a given time. The horizontal position of the spindles, however, baffled him; his fingers and the spindles would not work in harmony. One day, in 1764, a little toddling member of his family upset the spinning-wheel while it was being worked. Hargraves noticed that, while he retained the thread in his hand, the wheel continued to revolve for a time horizontally, giving a vertical rotation to the spindle. An idea started into his brain at once; here was the very thing he wanted. He saw that if something were contrived to hold the roving (a thickish coil of cotton) as the finger and thumb were wont to do, and to travel backward and forward on wheels, several spindles might be used at once. He set to work; and the result was a frame or machine which he called the spinning-jenny (very likely his wife's christian name was Jenny), having eight spindles. The family at once largely increased their weekly earnings.—*Chamber's Journal.*

PATENTS American and Foreign, obtained for inventors at prices as low as those of any reliable agency. Correspondence invited with inventors, and with those who have had their inventions rejected by the U. S. PATENT OFFICE, also with Merchants and manufacturers desiring TRADE MARKS AND LABELS.

INVENTORS If you want a Patent send us a model or a rough sketch, and a full description of your invention. We will make examination in the PATENT OFFICE, and if we think it patentable, will send you papers and advice and prosecute your case.

We refer to Hon. M. D. Leggett, Ex-Commissioner of Patents, Cleveland, O., O. H. Kelley, Esq., Secretary National Grange, Louisville, Ky., Rev. F. D. Power, Washington, D C., and to the Danish and Swedish Foreign Legation at Washington, D. C.

☞ Send Stamp for our "Guide for obtaining Patents." Address

Published and for sale at the Deseret News Steam Printing and Publishing Office, Salt Lake City Utah.

$1 250 PROFIT From investment of $250. One of our customers purchased a spread on 100 shares of N. Y. Central, the put at 106, the call at 108, buying 100 shares against the put at 107, which were sold at 114. Selling at the same price the other 100 shares called at 108, netting profit of $1,250. This operation can be repeated every month in the year. Ten, twenty, fifty, one hundred or one thousand dollars will pay as well for amount invested. Gold, stocks, cotton and tobacco bought and sold on commission. Advances on consignments. Send for price lists and circulars.

Rocky Mountain Pills

A VALUABLE MEDICINE,

From New and Rare Medicinal Plants recently discovered in the Rocky Mountains!

PURELY VEGETABLE.

FIFTEEN years of earnest botanical research among these mountains and valleys have resulted in the discovery, not only of many new varieties of plants, but of new species, some of which have wonderful medicinal curative properties. My continued experiment their virtues have become known—and thus from extracts of these newly discovered plants are these pills compounded.

If properly used, they will cure very many diseases, pains and aches, and are more especially valuable in DYSPEPSIA, LIVER COMPLAINTS, INDIGESTION, JAUNDICE, and all cases of FEVERS, COLDS, URINARY AND KIDNEY DISEASES, RHEUMATISM, COSTIVENESS, HEARTBURN, DIARRHŒA, MUMPS, MEASLES, for PURIFYING THE BLOOD, and for many other diseases, and all cases of BILIOUSNESS and DISORDERED STOMACH.

On orders accompanied by the cash or postal order, I will send safely by mail, postpaid, 1 box Pills for 25 cents; 1 dozen boxes, $2.50; 1 gross boxes, $20.00.

J. E. JOHNSON,
St. George, Utah.
