

## SOUTHERN CREAMRIES.

**Baby Prospects in the MILK Countries of the South.**  
The development of the great resources for dairying in the south deserves careful attention for one reason among others—that the milk writers afford the best opportunity for butter and cheese making. When all the milk writers are in advanced latitudes or working under disadvantages, no amount of the cold weather there are creamries now at work in Tennessee, Mississippi, Louisiana, South Carolina and North Carolina, and there are good reasons why there should be more now in the South. Butter made in the winter might be shipped to northern markets and to foreign countries, where the prices paid are enormous.

The foreign buyers is now in the hands of the Dukes and Peers, and these countries do not possess the conveniences that are found in the southern states. The buying is so cheap that letters may be sent for ten cents a pound, and the profit from the milk that would be made and shipped abroad would easily be equal to half as much. The conditions of the market are reversed in the north, for the milk writers afford equal advantages for butter making that are enjoyed in the southernities of the north, with a large preponderance in favor of the south. Dairying would sharpen the cotton producer, for it would fit the soil well for this crop and would supply the best manure for it.

In the southern mountains the temperature is reversed every day of the year, and the farms are mostly green, with the excepting pasture in the sunnier spots, in the shade woods, where a variety of grasses and edible seeds and the numerous cool springs afford the finest facilities for summer dairying in the whole country. Butter of the finest quality may be made here for less cost than elsewhere in the world.—American Agriculturist.

## Curd Cream Churning.

Vice President Morgan's butter maker has started the fashion of making Goosberry cream into butter at a very low temperature. His process, as explained to the editor of *The Rural New Yorker*, is as follows:

When the evening milking is about one-quarter done the separator is stopped, and the milk, warm from the cows, is run through it. In a few minutes after the milking is done the separator is all separated.

Then it is run down to about 45 degrees. It is then put into the cooling room and held at that temperature until the next morning. The morning milk goes through the same process, and as soon as it is sealed the night and morning creams are mixed together and churned.

"At what temperature do you churn?"

"Thirty-six to thirty-nine—why that is revolutionary! How long, pray, does it take to complete the churning process with the cream at that low temperature?"

"You will be surprised when I tell you that it takes only from twenty to thirty minutes. When we began to churn sweet cream we started in with the cream at a temperature of 62 degrees. But that was not satisfactory. In spite of our most careful and painstaking work the lard-like taste applied to the butter milk showed that we were losing about 2 per cent. of our butter fat."

"We then began a gradual reduction of the temperature, taking the butter-milk out at intervals of time. The first reductions were favorable—we were on the right track. When we had got down in 20 to 25 degrees, we found we were practically getting all the fat, the butter-milk showing only about one-twentieth of 1 per cent. As you say, this low temperature churning seems to set aside many preconceived opinions and the wise, but it works perfectly with us."

**Farm and COUNTRY BUTTER.**  
Our best hotels, restaurants and private customers pay higher prices for creamy butter than for any other kind. We have a large number of farms that offer the farm there is often a lack of facilities, and first class butter cannot be made. Too much of it is made in the kitchen, and the cream raised right where it can absorb the odors of boiled cabbage, onions or other vegetable. Give the skillful farmer and his wife the facilities of the creamery, and they will produce butter as fine or finer than can be produced in the creamery.

Many come—most of them from which the cream is taken from the milk, and some from the cream raised in the kitchen, and the cream raised right where it can absorb the odors of boiled cabbage, onions or other vegetables. Give the skillful farmer and his wife the facilities of the creamery, and they will produce butter as fine or finer than can be produced in the creamery.

All along in the journey of Justice from the milk jug to the butter tub there is a chance for butter to pick up favors foreign to its own.—Exchange.

**Making Butter Comes to Winter.**  
Nine-tenths of the people in the church do not claim it winter is the season the cows have been in milk a long time and give a milk which is some what vicious. Owing to this vicious or staleness there would seem that the fat globules are not able to clear themselves and adhere to form the larger butter globules. The best way to remedy this difficulty is to have part of the cows fresh in the fall, in which case the difficulty usually disappears. If milk is set in deep cans, past in each of the bottoms of the cans at time of setting, this will help to prevent the shallow nut setting. Since the cream from shallow nut setting is very thick, filtering it with water, and also not a little salt at churning time.—Prologue.

**The Home of Many Friends.**  
Lady Dill has been well visited as a home of reunion. She is said to be the Director of "Home-making" at the Monte Carlo, and while her tree-lined residence is a picture of beauty, she is equally popular in the hotel, due to the example of Ruth Livingston's untiring service of that house, and to the lovely young wife of Livingston, who is always happy, ready to help the other girls—Lillian Livingston.

Makes a baby mat and a bow as a gift to a friend. The mat, filled with hair from the bottom, and tied at the ends when the baby is dressed on it, is a perfect baby bumper to the mother for a gift. It will be missed and sent to the World's Fair.—St. Louis Republic.

## THE MILK CONCERNING INDUSTRY.

"Cure Early, Satisfy" Box and What Case of It.

About forty years ago Gull Boston, a civil engineer of New England, invented the idea that milk could be kept clean in a vacuum till from the liquid condition it became substantially solid, and as that state preserved by means of another vacuum invention he sought the patent and held it for many years. Mr. Boston had lived long in the south, particularly in Texas, and he found on the other hand of such an article as his invention would probably if his idea was practicable. He began experimenting on this and other meat, but, however, in his experiments his prices paid are enormous.

Eighteen years ago he experimented with the milk condensing. He made a success of the experiment, but he could not sell it. He did not know where to go for the money to pay on his invention. He sold all the new ones on his invention, but he was not the best. People who knew him, especially the neighbors, made every effort to get the best of his invention. They would have believed a man could take wings and fly to heaven itself as easily as this milk condensing machine. The man who would think of such a thing was nothing less than oil in his head. So they called him "Crazy Uncle Gull," those kind neighbors.

But Uncle Gull had a son, John G., who was a practical engineer, and he helped his father to sell his invention. Gull Boston died in 1880, and John was a success. He was an inventor, and Prudential kindly sent him a sum that was to him a fortune. The only trouble being that Uncle Gull had to wait eighteen years till the son was old enough to take hold of the financial end of the business. Then it became one of the greatest successes on record.

The other day we waited patiently and hopefully for the arrival of the new issue of the *Evening News*. The day before the little condensing became a financial success, Gull was an inventor, and Prudential kindly sent him a sum that was to him a fortune. The only trouble being that Uncle Gull had to wait eighteen years till the son was old enough to take hold of the financial end of the business. Then it became one of the greatest successes on record.

Then it became one of the greatest successes on record.

Well, there are now six great Boston milk condensing plants in various parts of the country. Two of them are in Illinois. Not long since I visited one of the New York factories. It is not one of the largest, yet it alone consumes 30,000 quarts of milk a day, manufacturing dairy products, cheese, butter, and various products. When the whole factory is turned over to the manufacture of cheese, the output is calculated from this. The condensed milk goes all over the earth. Poetry took it to the motto pile with lies. Exports flavor their coffee with it under the equator in Africa. Best of all, "Crazy Uncle Gull" lived to see the enterprise he had set his heart on assume almost its present colossal proportions; then he rested from his labors with the sweet consciousness that he had helped mankind.
