It augurs well for this being charged with damp from be- than those just stated. From the city that steps are being taken in neath, but it leaves a convenient kitchen there is distributed advance to prevent the spread of space in which all repairs connected throughout the house a constant that loathsome contagion, small- with water supply, gas supply and supply of warm as well as cold wapox, which is seriously afflicting sewerage can be carried out. The ter. The weighted dishes have to Ogden. At the same time it should living part of every house begins on be carried down instead of up stairs; be borne in mind that unnecessary the level of the street, and the the light dishes only have to be liness and a strict exclusion of Chadwick has found, a pound dust bin shaft, and from every floor occasions, but not too freely. As in vapor into the warm rooms; cre- carrying the heavy slop-pail from weather, and leading to those phys- gether. Above the kitchen is the ical evils from damp of which con- arched roof of the house. The roof, sumption of the lungs is the most which is flat, or nearly so, on the prominent form. To avoid the exterior surface, is coated with dangers from this cause the bricks asphalt, and, being barricaded with used are made of glazed substances, a light iron pali ading, makes an and are quite impermeable to water. | airing ground, or a drying ground, The bricks are perforated, at the or even a garden, according to the end of each is a wedge-like opening, tastes or the requirements of the and all the openings communica- owner. The smoke from the chimte. The walls, therefore, are neys is collected and drawn away honeycombed, and into them a to a central shaft, so that the air is body of air constantly circulates, kept clear of soot-dust, and a pure which air can be warmed from the blue sky overhead is obscured only fire grates of the house. The walls by the curtain of cloud which naof the living-rooms are lined with glazed tile, and can be washed wise sometimes to impose,-Good down as an earthenware vessel is washed. The color of the walls is gray, as a rule. The mortar and cement in which the bricks are laid, and all the timbers employed in the buildings, are rendered- free of moisture. Sea salt, so common an ingredient of mortar made from sea sand, and so often present in wood that has crossed the sea, and so efficient as an absorbent of water, is carefully excluded. The most radical improvements to our system of model habitations lie in the arrangement of the roofs and the kitchens. In the houses of the present day the kitchen is at the basement, while the upper part of the house is carefully sealed down by the roof. The result is that all the close and disagreeable, and it may be, foul and dangerous vapors from the kitchens and lower offices ascend to the upper rooms and passages of the house, just as gases introduced into an inverted bell jar filled with water ascend to the water. In our model houses the risks from this cause are avoided by placing the kitchen at the top of the house, immediately beneath the roof. The kitchen acts as a ventilating chamber, into which all the

At 1 p.m. the Louis Ordner haon both sides.

At 2 p. m. it was withdrawn till to-morrow at 9 a. m., and the former case again taken up.

Yesterday Mr. Driver, of Ogden, having been convicted of selling liquor without having paid the Government tax, was fined \$100 and placed in custody of the Marshal for thirty days.

here, as sanitary regulations will be likely to be vigorously enforced.

A Sketch of the Possible Model Habitations.

The living space is assumed to be so arranged that not more than twenty-five persons are lodged on an acre of ground. That is calculated as the densest population that could be safely housed. The houses in which the population reside are so planned that each acre of land can receive a family of five persons. The houses are built three or at most four stories high, and each story is confined to fifteen feet in height, by which means the great evil of tall, over-shadowing, dessely packed human warehouses is prevented. The houses are built on solid arches of brickwork, so that where in other towns there are areas and kitchens there are here subways through which the air flows freely, and down the inclines of which all currents of water are carried away. The streets of the city, wide, and, owing to the lowness of the houses, well lighted and thoroughly ventilated, are laid also on archways, and beneath each of the main streets is a railway by which all the heavy traffic of the place is carried on. The streets are planted on each side with trees, in many places with shrubs and evergreens. They are paved with wood, set in asphalt, and the side ravements which are everywhere ten feet wide, are of light gray stone. These pavements have a slight incline towards the streets, and the streets have an incline from their centers towards the margins of the pavements. The streets are washed every day, through side openings, into the subways, the
