

MINING, BUSINESS AND STOCKS.

SOON TO OPERATE DIAMOND DRILLS

Tintic Smelter Is Closed—Scotia Mine Is Shipping—Hoist and Other Equipment at Gold King.

(Special to The News.)

Eureka, Oct. 5.—According to the statement of Manager J. C. Sullivan of the Raymond-Milliken that property will, within the next two weeks, put in operation diamond drills in its underground workings. In this present work has been carried out to a depth of 1,500 feet. Some water has been encountered at this level, and to go deeper in the ordinary manner would necessitate the putting in of a pumping plant to handle the water. With diamond drills it will be possible to develop the ground, or rather prospect it, to a depth of 500 to 800 feet deeper than where work is now being carried on.

The shaft at the East Tintic Development company mine has reached a depth of about 400 feet, and as soon as the workings reach the level sinking will be stopped and a crosscut sent out in search of ore at that depth. Two sets of mica ore were sent out from the mine this week.

Everything is at a standstill at the Tintic smelter, aside from a few men working in the carpenter shop, laboratory, office, and in cleaning up around different parts of the plant. The furnaces have all been "pulled" from the furnaces and the small army of men which was employed has left, given the place a somewhat deserted appearance. Local mining men are of the opinion, however, that it will soon start up again under entirely new ownership and management.

Teams which are now hauling coal to the McIntyre pumping plant, which is located about four miles this side of the Scotia mine in West Tintic, will haul ore from the Scotia mine to the railroad switch at Boulder, on the San Pedro railway, from which the ore will be sent to the plant. The ore will be sacked so that it can be handled easily, and by hauling a load of coal out and returning with ore the expense of hauling will be materially cut down. For several years the Scotia mine has been producing good ore. The present output will be about 10 carloads, for which the company has a contract. This is said to be a small part of the ore which the company has awaiting shipment at the mine.

MAY SELL STOCK.

The shareholders of the Diamond Queen Mining company, at a recent meeting, heard reports that the company is in a splendid financial condition, the property is improving every day. The directors now have an opportunity to place a stock of stock at an advantage price, and a meeting will be held Oct. 10, to decide whether the stock will be issued. If this treasury stock is disposed of it will mean complete equipment for the mine and an extensive campaign of development work. The tunnel has been driven 290 feet and this with a 50-foot crosscut gives the company about 340 feet of work upon the tunnel level. The face of this tunnel is now in manganese, quartz and calcite veins.

The new hoist and other equipment at the East Tintic Gold King property is now working in good shape, and excellent time is being made in developing this ground, which is in the eastern part of the district and is considered among the best upon the "east side." The shaft is at present down a depth of 150 feet, and as soon as it reaches a depth of 250 feet, crosscutting will be undertaken, and it is believed that this will be encountered at a depth of 250 to 300 feet. The shaft is at present in mineralized lime, with strong iron indications. This, together with the loose character of the ground, are considered good indications of ore.

TINTIC CENTRAL GOES HIGHER.

Stock Reaches High Point and Then Starts to Go Down.

Tintic Central was again the feature of the stock market this morning and although the stock was boosted up to 11½ cents it then started downward and closed at 10 cents. This is the highest point the stock has ever reached at this time, and is due to be due to the fact that the shaft has struck the dolomitic lime, which is the making of ore in the Tintic district. There were more buying orders for the stock this morning and not so many evidences of manipulation. During the regular session 15,000 shares were disposed of. The stock opened at 10½ cents and gradually moved up to 11½ cents. It also started at the high price on the open board, but dropped to 10 cents at the close. During the open board 15,600 shares were sold.

Ohio Copper enjoyed a little burst of activity and considerable more stock than usual changed hands. The stock was slightly higher this morning. Colored red strong this morning and was back at \$1.50 at the close. Sioux Consolidated showed a slight improvement over yesterday's price.

The total number of shares sold on the board this morning was 68,659, while the amount represented by the transactions was \$16,782.77.

There was considerably more trading in the curb market this morning than usual. Clinton Treasure Hill went at 5½ cents for 500 shares. Bingham Central Standard showed considerable activity and two 500-share lots were over the rail at 25 cents and 26½ cents. A Ohio Kentucky sold at 15 cents for a 400 share lot. Clark Consolidated received a bid of 51½, and was offered at \$1.75.

BEAVER LAKE CON. HAS SOME FINE ORE

Secretary of Company Returns With High Grade Specimens From Beaver Lake District.

For some time the Beaver Consolidated Mining company operating in the Beaver Lake district, Beaver county, has been finding some excellent ore, but the specimens that A. F. Palm, secretary and treasurer of the company, has just brought back to Provo with him are by far the best. According to the chief engineer at the property the company is advancing to a state that promises a great future.

It is declared that after the 18-inch vein of ore pinched out in the shaft at a depth of 150 feet, the shaft was pushed through to a vein of very hard granite. After penetrating this the lead was picked up again and within the past 10 feet the vein has widened to two feet of excellent ore that is easily mined.

While Mr. Palm was at the property he says he picked out half a ton of ore in less than two hours. In the drift they have a three foot vein of highly mineralized quartz with a dip of 45° to the south, running parallel to the main body, assuming the perpendicular rapidly the management thinks that a large body of ore is close at hand. Mr. Palm declares that the rich ore that is now being found will bring from \$500 to \$7,000 net a car.

WILL EQUIP PROPERTY.

Activities to be Increased at Foster Property at Pioche.

D. D. Houts returned from Pioche yesterday where he has been inspecting the recent disclosures in the Foster property. He says that it is the heaviest strike he has ever seen.

He says that the shaft on the hill at the property has encountered four feet of ore, but that not all of it is high grade material. Mr. Houts returned with some fine looking specimens taken from the shaft. Each sample shows high grade silver values. In most of them there are strong showings of chloride and bromide of silver. To one untrained eye the ore looks almost impure, but it does not contain a good percentage of copper. It is declared that there is not even a trace of copper.

It has always been the theory of Pioche people that ore would not be found in the quartzite as it was not in the quartzite, where all the other big mines of the district had been made. Shortly after the first of the year Alex Cobalt of Salt Lake City became interested in the property and engaged in getting Judge Houts interested.

After thoroughly prospecting the territory for about four months, Mr. Cobalt began sinking a shaft on the quartzite fissure that appears to have come up through the lime and can be traced for 2,000 feet through the property. In some places this fissure is 10 feet wide and through the work of the rock miners have been secured.

Mr. Houts has had a number of assays made from the specimens taken out of the shaft, which at the time Judge Houts left had only reached a depth of 40 feet. The lowest assay made ran 71 ounces in silver, 11 per cent lead and several dollars in gold. The highest assay made was 100 ounces in silver, 22 per cent lead and \$2.20 in gold.

Last night Mr. Houts received word from Mr. Cobalt that the new shaft, just started about 300 feet lower down the ridge, had struck chlorides. This showing was made at a depth of about 10 feet.

The property is now to be equipped with machinery so that prospecting and development work may be carried off at once. Mr. Cobalt and Mr. Cobalt have been working slowly for the purpose of being certain. Now that they have reached a conclusion relative to the property they will waste no time in pushing the work.

SA FRANCISCO MARKET.
