

A PORTABLE FENCE.

A Fence That Can Be Used for Fencing
Rocks, Shading Pasture Lots, Etc.
We are indebted to Country Gentleman
for the accompanying drawings of a portable
fence. In the first cut are shown

NEEDLE FOR WIRE.

Two sections coupled; in the second cut
is illustrated a support for the same.
Country Gentleman says:
This fence is the most durable and perfect
that I have ever seen. Forty rods of
it can be drawn in one load and put up
by two men in an hour. In making the
posts he says and have the 2 by 2
rights, to which the boards are attached
at the ends, on different sides of the
boards as shown in the cut. The 2 by 2
should extend one foot above the top
board, so that in case the fence is used
to enclose cattle or horses a wire can be
run in, and by driving an
eighteen penny wire nail about half its length
in the top and tacking it down over the
wire.

By this arrangement the wire can be
taken off by simply prying up the nails.

SUPPORT FOR SECTION OF FENCE.

This fence is in constant use with up
in fencing or dividing pasture lots, and in
enclosing stacks from stock.

Best of Oak Fencing.

An experiment, conducted at the Ohio
experiment station and just reported, in
fencing out in back water indicates that
by this method the greater portion of the
loss from the sink of oak may be pre-
vented. The process, briefly stated, is
as follows: Have two rows, in one of
which water is kept warm to about
100 degs. Fahrenheit, and in the other to
as nearly exactly 50 degs. as possible.
Have a basket of wire netting, or a loose
sieve laid covered with cloth. The water
baths must be large enough to admit
of the basket. Fill the basket with
wood grain and tannine. In the cooler
bath, keeping it there and stirring it
around until all the grains are warmed,
then lift it out and plunge it into the hot
bath, where it should remain from eight
to ten minutes, being stirred or agitated
meanwhile. Then remove it and dip it
into cold water, or spread the grain out
and throw cold water over it, after
which dry it sufficiently for sowing.

The effectiveness of this method de-
pends upon having the water hot enough
to destroy the insect germs which may
be adhering to the outside of the grains
of oak, but not so hot as to destroy the
germs of the oak. Experiment has dem-
onstrated that this may be accomplished
by making the grain in water of the
temperature indicated. The reason for
using two vessels is that if one vessel
were used the water would be cooled too
much by the cold grain to accomplish
the purpose in view, or if it were heated
hot enough to do this, it would be so hot
as to destroy the vitality of much of the
grain.

Two Crops to the Orchard.

Many farmers endeavor to secure two
crops from an orchard—fruit and grass—
the result being that the grass is the
worse, while the trees in turn, since the
grass and draw upon the land for their
share. Some fruit trees, such as the
apple, will permit a single year of
grass growing on the ground of the orchard
and though such is not the case with
apple and pear, yet the lesson from the
condition of the ground under such
conditions teaches that grass at least
a drawback. It may not be proper to
frown the young trees too rapidly at first,
and to trust that an occasional grass
crop plowed in has given beneficial
results, but to keep an orchard as a pas-
ture is to occupy the ground with un-
profitable fruit trees. An orchard should
be kept mostly trimmed, well fertilized
or manured and cultivated thoroughly
at least once a year, says the Philadel-
phia Record.

Beware of the Apple Tree.

So long as a tree has a solid trunk it
is worth taking the best of care of it,
says American Cultivator, and this in-
cludes grafting if the variety is unpro-
ductive or otherwise undesirable. On
most old trees some four growing variety
succeeds best, as it is less likely to run
wild than it is in the case of the stock.
This should be followed by the old stock
to supply enough sap for the grafts
to grow to fruit bearing. Thus with ap-
ples the Northern, say graft on any old
tree will bear in two or three years,
while a young tree of this variety takes
a very long time to come into bearing.

What Others Say.

A man of family who has land and
will not grow some grape vines should
be deprived of citizenship, says Popular
Gardening.

Rural New Yorker advises giving

a few hills of the Portland squab, as
concurrent testimony ranks it as one of
the best of all your round varieties in cul-
tivation.

Flowering and timing the poultry run

purge the soil. It probably needs it.
The young broods will do better if
placed on new ground, away from the
old run.

The sheep industry in the United

States is rapidly changing from a wool
to a mutton basis. This will give it a
permanency.

Over come brain and soil and fine

Two much dry and rich soil will make
very strong man. Inconclusive foods
will prevent this, says The Farm Jour-
nal.

To prevent rust in wheat field and
Farm advises the destruction of the
green of the rust fungus in the soil and
the seed. This may be done by wash-
ing the seeds immediately after harvest
and sowing deep, and by sowing the
seed in a mixture of vernal and autumn
sowing, but that they should all mature at
the same time.

TRANSPLANTING CABBAGE PLANTS.

Directions Concerning an Operation of
Importance to the Prospective Grower.
The best soil for cabbage is a rather
heavy loam, not less than ten inches deep
and with good drainage. A proper pre-
paration of the soil is important, and

PLANTING OUTDOOR CABBAGE PLANTS.

When it has been plowed the previous
fall as much the better. We will re-
commend for early cabbage ought to be
sown broadcast.
It ought to be borne in mind that cab-
bage is a hardy plant, hence when want-
ing for an early crop they may be set out
in any section as soon as the soil is dry
enough to work.
In the illustrations here reproduced
from "How to Make the Garden Pay,"
are shown various ways of setting the
plants. Grower, the author, says on the
subject:
Cabbages may be set either straight
down or slanting, according to depth of
surface soil and length of stalk. In
either case roots will form all along the
stalk, and the plants will grow closely
above the ground, instead of being held
high up as if on stilts. The contrast be-
tween deep and shallow planting here
illustrated speaks plainly in favor of the
former. The advantage of deep plant-
ing is that it gives the plant a solid
base, and the stalks will grow close to-
gether, thus protecting the plants from
frost and cold winds.
